FT Panel 3.6 — What's new

What changed in this version? Orange numbers point to the places in the pictures.

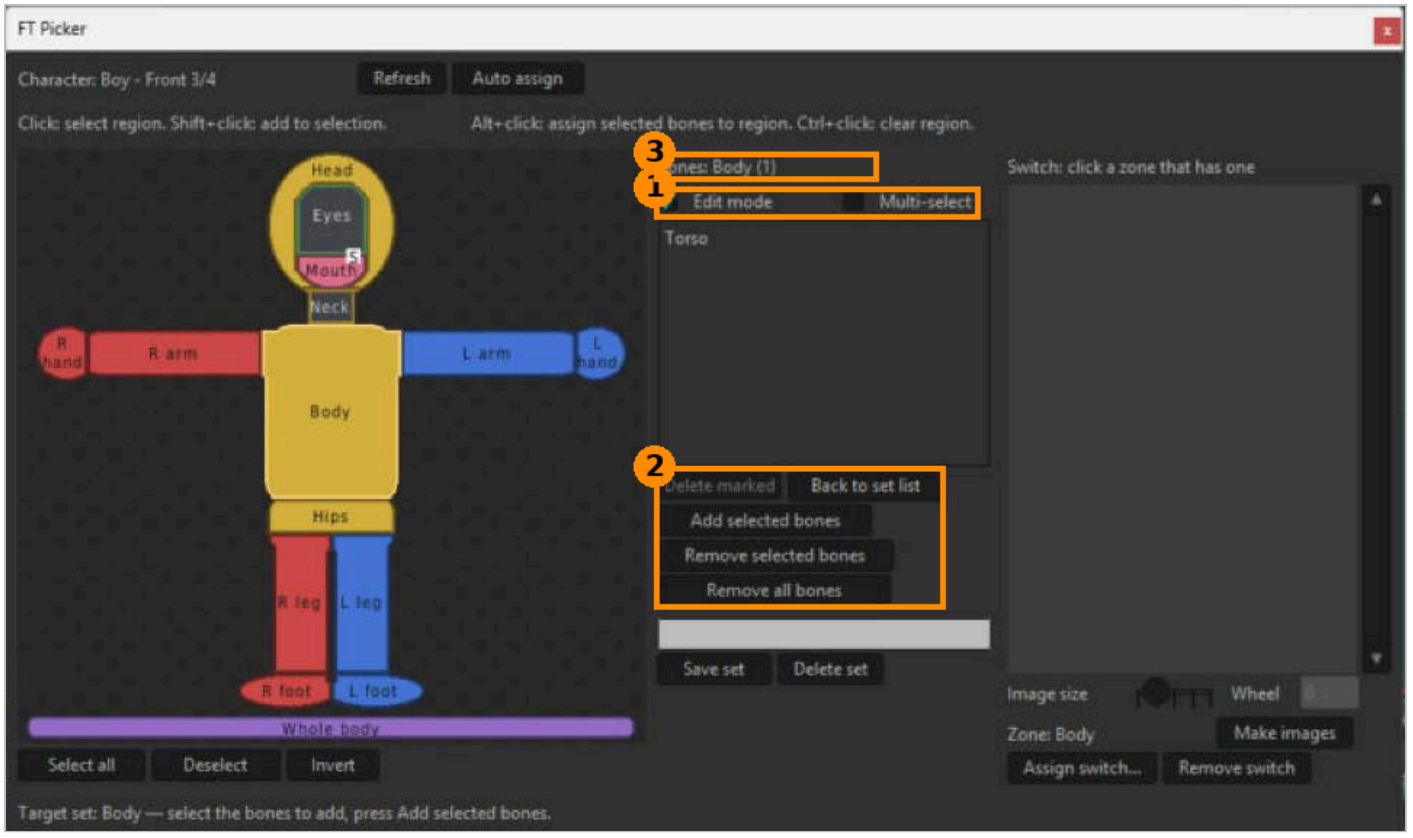

1. One-click updates

- ① The **Check for updates** button at the bottom of the main panel looks for a new version.
- If there is one, you see what changed; press **Update** and the files are downloaded, verified and replaced. This guide opens automatically.
- Restart Moho after updating. Your license stays valid.
- ② The signature is 50% smaller, leaving more room for the status line.

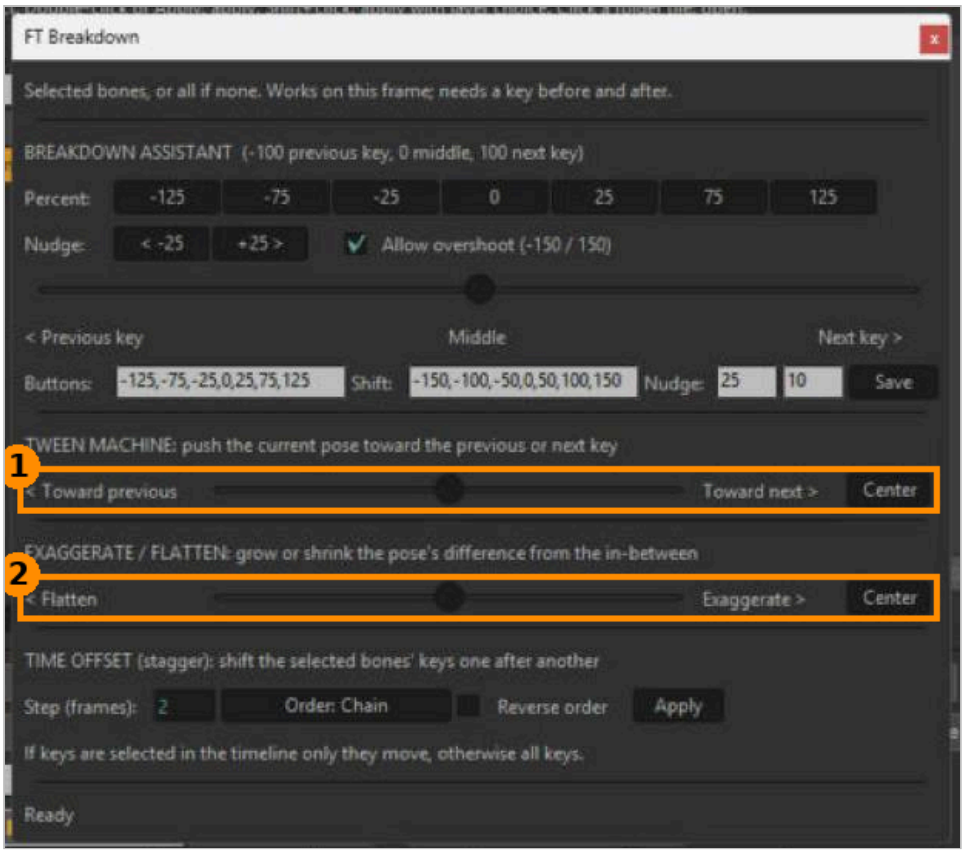

2. Picker: editing sets

- ① Tick **Edit mode**. Click a zone on the figure or a named set in the list: the list on the right shows that set's bones ③.
- Select bones on the character and use the ② buttons: **Add selected bones**, **Remove selected bones**, **Remove all bones**.
- With **Multi-select** on, clicked list rows get an **[x]** mark; **Delete marked** removes them all at once (bones or sets).
- **Back to set list** shows the named sets again. With Edit mode off everything works as before.

3. Tidier windows

- Empty space was removed from all windows and related buttons were grouped.
- Breakdown: ① Tween Machine and ② Exaggerate now fit on one row each, with the Center button right next to them.
- In the main panel the layer button moved to the Folder row; the Import window is smaller; in the Picker the buttons sit under the list they act on.

FT Breakdown
Selected bones, or all if none. Works on this frame; needs a key before and after.
