9. Import
10. Troubleshooting

1. Overview

FT Panel is a Lua tool for Moho Pro 14.4. One toolbar icon opens a main window that brings together:

- **Pose and animation library**: folders, thumbnails, animation preview
- **Breakdown**: in-betweens, tween, exaggerate and time offset (stagger)
- **Picker**: T-pose character template, selection sets, switch layers per zone
- **Switch**: pick switch variations from thumbnails
- **Characters**: Harmony-style open/close character libraries
- **Import**: import video/audio and match the scene length

> The character in this guide was generated with Moho's own **Character Wizard**.

2. Requirements

- Moho Pro 14.4 (tested on Windows)
- An internet connection for license activation and update checks
- A license key (sent in your purchase email)

> Since 3.6 a Custom Content Folder is not required. The script can also be installed in Moho's own program folder.

3. Installation

Copy the **contents** of the package's `Scripts` folder (`Tool`, `Menu`, `ScriptResources`) to one of two places. Do not rename folders or files.

Option A: Custom content folder (recommended)

1. In Moho choose **File > Open Custom Content Folder**. This is the folder that contains `Scripts`. Then quit Moho.
2. Copy the package's `Tool`, `Menu` and `ScriptResources` folders into its `Scripts` folder (they merge with existing folders).

Option B: Moho program folder

1. If you have no custom content folder, copy the same three folders into `C:\Program Files\Moho 14\Resources\Support\Scripts`. Windows asks for administrator permission.
2. With this install, **Check for updates** cannot replace files itself (admin rights are needed). Copy updates manually.

First start

1. Start Moho. The **FT** icon appears in the **Other** section of the toolbox. Click it.
2. The **license window** opens. Paste the license key from your purchase email and press **OK**. Activation is needed once and requires internet. If you have no license, the **Buy a license** button in the same window opens the store page.

3. **Data folder**: if there is no custom content folder, FT Panel asks you to choose a folder. Poses, settings and panel images are installed there. The choice is saved and not asked again. A folder on another drive works too (e.g. `K:\Moho\FT_Panel`).
4. The main panel opens.

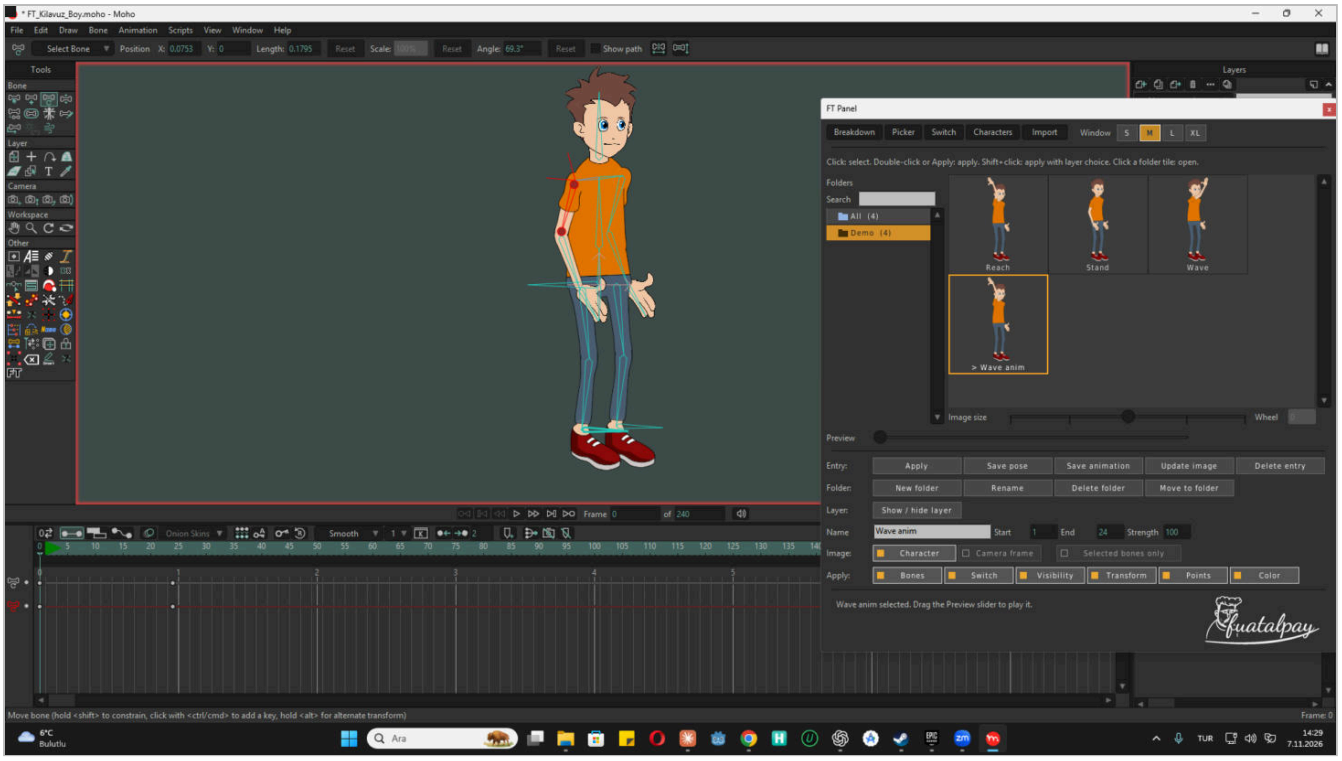

Updating

Check for updates at the bottom of the main panel looks for a new version. If one exists it shows the release notes; choose **Update** to download, verify and replace the files. Then restart Moho. After updating, the what's-new guide for that version opens.

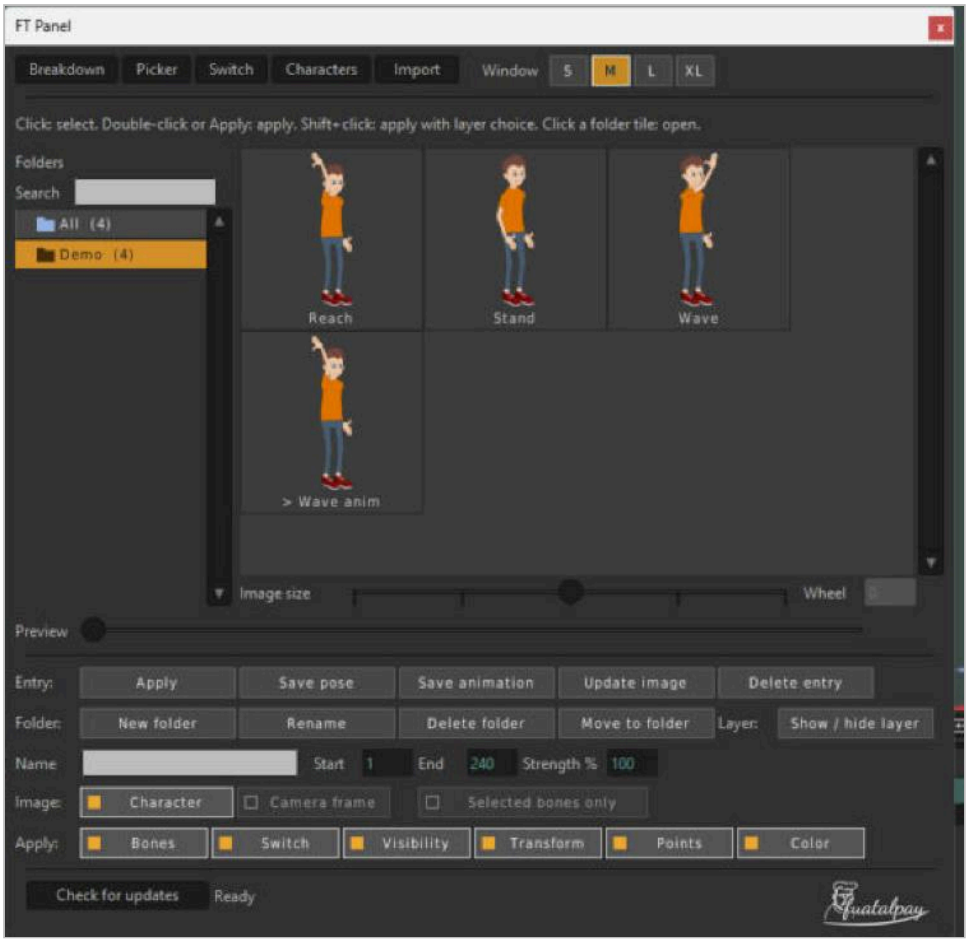

> To update manually, copy the same files over the old ones. Your poses and settings live in the data folder (or in `ScriptResources\FT_Panel`); do not delete that folder.

> Moho cannot assign keyboard shortcuts to menu scripts; shortcuts can only be assigned to tools (the FT icon).

4. Main panel: pose and animation library

A Character Wizard character with FT Panel on the right.

The pose library. Check for updates and the status line at the bottom.

Top row

Breakdown, Picker, Switch, Characters, Import open their windows. **S / M / L / XL** saves the panel size; it is applied when you close and reopen the panel. A window that is already open is not opened twice; the status line tells you. Closing the main panel also closes the windows opened from it.

Folders

Folders on the left are shown as tabs; the selected one is orange. Click the arrow to expand or collapse. **Search** filters by name.

- **New folder**: creates a folder with the name in the Name field inside the selected folder.
- **Rename**: renames the selected folder.
- **Delete folder**: deletes the selected folder (asks first).
- **Move to folder**: moves the selected entry to another folder.

Entries

- **Save pose**: saves the pose on the current frame under the Name. Selected bones only, or all bones if none are selected.
- **Save animation**: saves the keys in the **Start–End** range (max 2000 frames) plus 12 small preview frames.
- **Update image**: refreshes the selected entry's image. For animations the Start/End range is captured again.
- **Delete entry**: deletes the selected entry (asks first).

Applying

- Click: select. Double-click or **Apply**: apply. **Shift+click**: choose the layers to apply to.
- **Strength**: apply strength (%). 100 is the full pose, 50 is halfway.
- The **Apply** row chooses what is applied: **Bones, Switch, Visibility, Transform, Points, Color**. An orange box means on.
- The **Image** row sets how thumbnails are taken: **Character** (cropped to the character), **Camera frame**, **Selected bones only**.
- **Preview**: with an animation selected, drag the slider to play its saved frames. Moho has no timer, so there is no automatic playback.
- **Image size** and **Wheel**: thumbnail size; turn the mouse wheel over the Wheel box to scroll the list.

Show / hide layer

The **Layer** button at the right of the Folder row toggles the visibility of the selected layers on the current frame and sets a key.

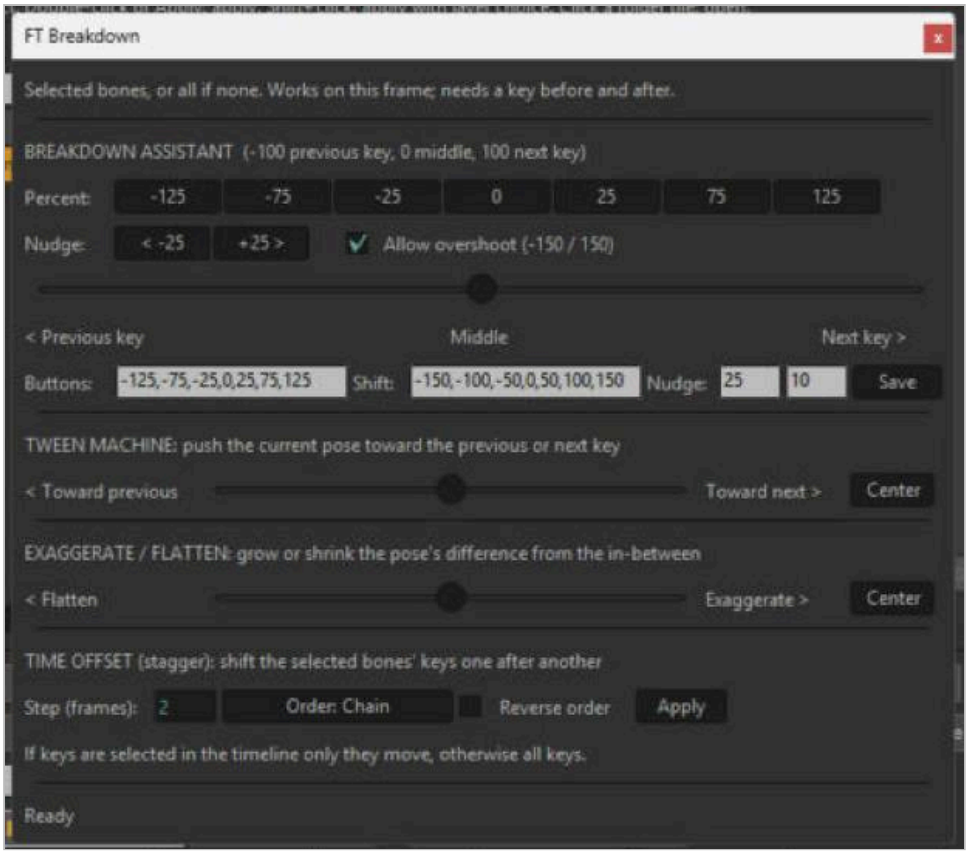

Bottom row

Check for updates checks for a new version (see 3. Installation). The status line next to it shows what happened and any warnings.

Menu command

Scripts > FT > FT Apply Pose applies the entry selected in the panel.

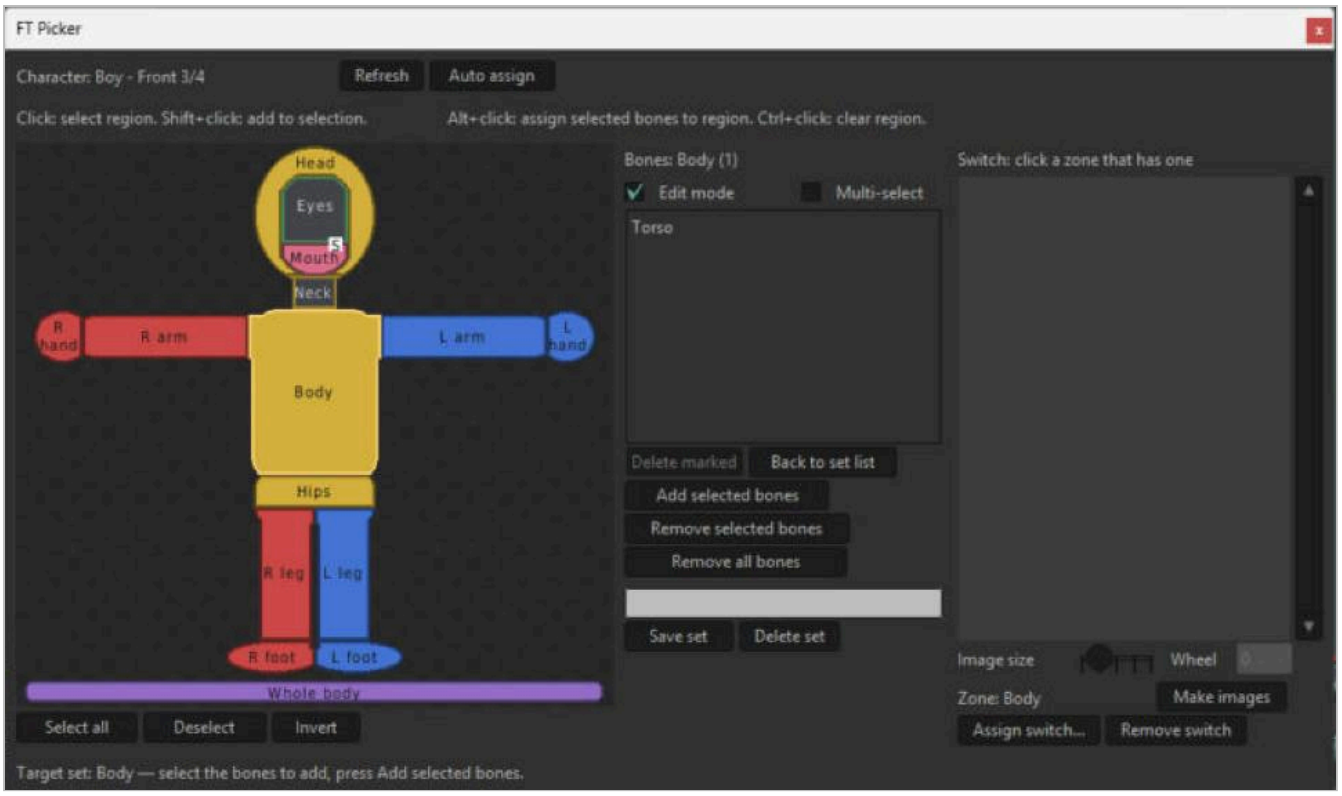

5. Breakdown

Works on the selected bones (all bones if none) on the **current frame**. There must be a key before and after.

- **Breakdown Assistant**: in-between from the previous key (-100) through the middle (0) to the next key (100). Use the preset buttons or the slider. **Nudge** pushes in steps of 25. **Allow overshoot** extends the range to -150/150.
- **Buttons / Shift / Nudge fields**: edit the preset values and press **Save**.
- **Tween Machine**: pushes the current pose toward the previous or next key. **Center** resets.
- **Exaggerate / Flatten**: grows or shrinks the pose's difference from the in-between.
- **Time Offset (stagger)**: shifts the selected bones' keys one after another by **Step** frames. **Order: Chain** or **Order: Skeleton**; **Reverse order** flips it. If keys are selected in the timeline, only those move.

6. Picker

The Picker with Edit mode on. The Body zone is selected; the middle list shows its bones.

Template and zones

- The template is a T-pose character. Zones: Head, Eyes, Mouth, Neck, Body, Hips, arms, hands, legs, feet and Whole body.
- **Auto assign**: fills zones from bone names. Filled zones are colored. **Refresh**: re-reads the character.
- Click: select the zone's bones. **Shift+click**: add. **Alt+click**: assign the bones selected in Moho to the zone. **Ctrl+click**: clear the zone.
- **Select all / Deselect / Invert**: select all bones, clear, or invert the selection.

Selection sets

- The middle list normally shows your saved sets. Clicking a set selects its bones. Sets are stored per character.
- **Save set**: saves the bones selected in Moho as a new set, using the name in the field below. **Delete set**: deletes the selected set.

Edit mode: editing sets and zones

1. Tick **Edit mode**.
2. Click the **set** (in the list) or **zone** (on the template) you want to edit. The list switches to that target's bones; the header reads **Bones: <name> (count)**.
3. Select the bones you want in Moho and press **Add selected bones**.
4. **Remove selected bones**: removes the bones selected in Moho from the target. **Remove all bones**: empties the target.

5. **Back to set list**: returns from the bone list to the set list.

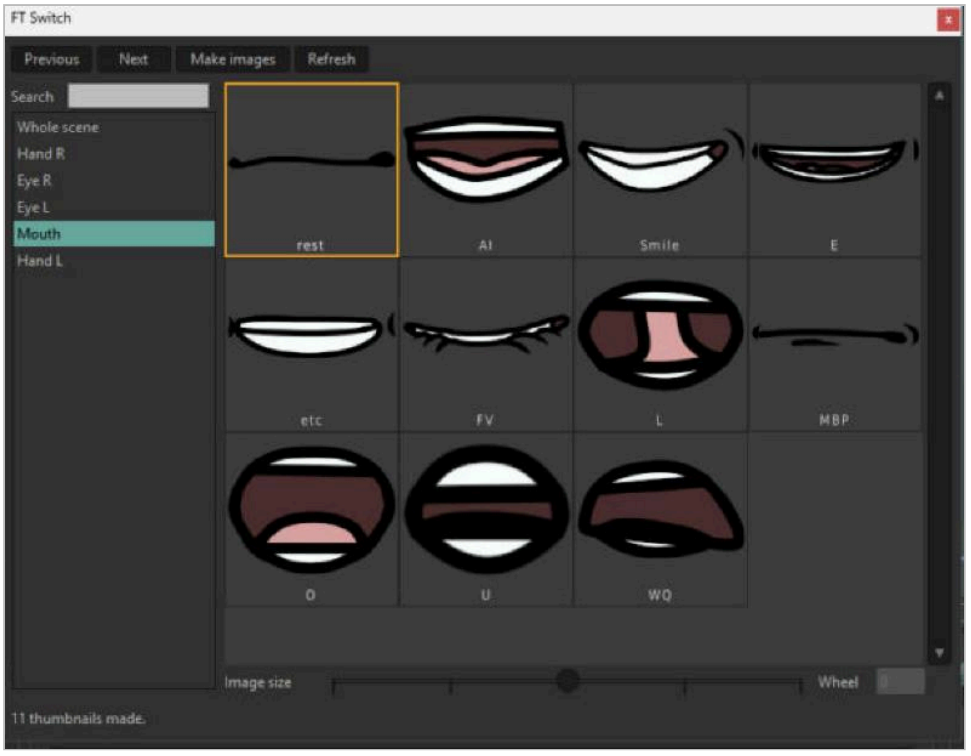

With **Multi-select** on, you can mark several rows in the list. **Delete marked** deletes the marked sets, or (in the bone list) the marked bones, in one go. The bottom line shows which target is being edited.

Assigning switches

- The right side is for switches. **Assign switch...**: assigns a switch layer to the selected zone; a white **S** badge appears.
- Clicking a zone with a switch shows its variations on the right; clicking one applies it on the current frame. **Remove switch** removes it.
- **Make images**: creates the variation thumbnails. Go to any frame other than 0 first.

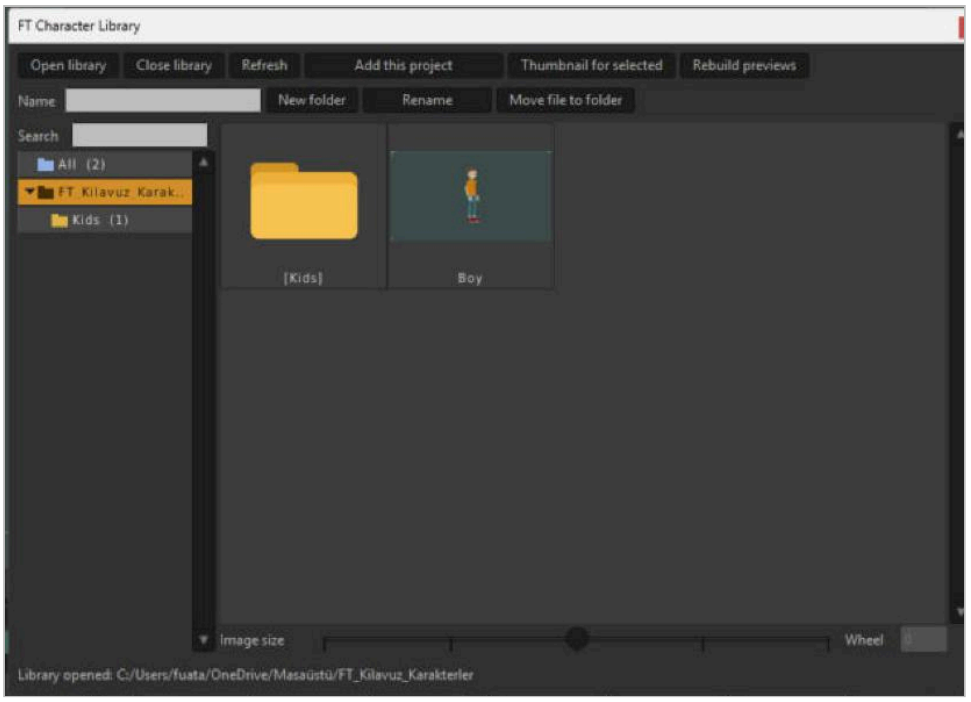

> Moho can deselect some hidden bones by itself. If you select from the Picker and save right away, all intended bones are saved.

7. Switch

- The list on the left shows the switch layers in the scene. **Search** filters it.
- Clicking a variation applies it on the current frame (sets a key).
- **Previous / Next**: step through variations. **Make images**: create thumbnails. **Refresh**: reload the list.

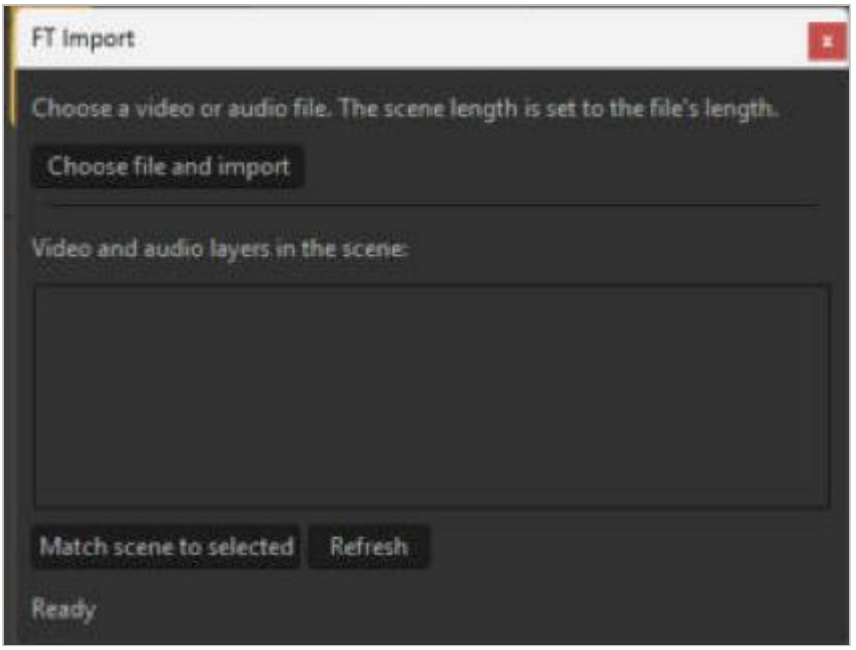

8. Characters: character library

Libraries are opened and closed like in Toon Boom Harmony. Several libraries can be open at the same time.

- **Open library**: choose a folder; it is added to the list on the left. Subfolders are scanned up to 4 levels deep.
- **Close library**: removes the selected library from the list. **Files on disk are not deleted.**
- Previews are made automatically from the image inside each `.moho` file. For `.mohoproj` the `preview.jpg` next to it is used. **Rebuild previews** remakes them all.
- Click: insert as a copy. **Shift+click**: insert as a reference. **Alt+click**: select. Moho shows its own "Insert Object" window while inserting.
- **Add this project**: copies the open (saved) project into the selected folder.
- **Thumbnail for selected**: takes a scene image for the Alt+clicked character.
- **New folder / Rename / Move file to folder**: folder actions. A library itself cannot be renamed here. Deleting folders is intentionally not available.

9. Import

- **Choose file and import**: imports a video or audio file and sets the scene length to the file's length.
- The list shows video/audio layers in the scene. **Match scene to selected** sets the scene length to the selected layer. **Refresh** reloads.

10. Troubleshooting

- **No FT icon:** make sure the `Tool` files are in `Scripts\Tool` of the custom content folder or of Moho's program folder, and restart Moho.
- **Panel images missing / a folder is requested:** the data folder was not found. Choose a folder in the window that opens; the needed files are installed there automatically. The choice is stored in `%APPDATA%\FT_Panel\datadir.txt`. Delete that file to be asked again.
- **"Could not reach the license server":** check your internet connection and any firewall or antivirus settings. Keep the detail line under the message for support.
- **Check for updates could not replace files:** if the script is installed under `Program Files`, copy the update manually or install the script in a custom content folder.
- **"This window is already open":** the window may be behind another window.
- **Panel size did not change:** close and reopen the panel after choosing S/M/L/XL.
- **Breakdown does nothing:** there must be keys before and after the current frame.
- **Switch thumbnails are empty:** go to a frame other than 0 and press Make images again.
- **Animation save refused:** the Start–End range cannot exceed 2000 frames.
